

NEXT — running handoff log (append-only)

Sprint B — Track B (M1-M3) · branch `agent/abacus-sovereign-sprint-v4`

Milestones M1-M3 built, verified, committed and pushed. M4-M8 intentionally NOT started (separate later subtasks: A5 intake engine, A3 Intelligence section, A4 Wompi/GPS, A2 §3 Nostr binding).

M1 — Identity spine + rename · commit `a5f808f`

- Migration **026** (additive): `subject_id` on 26 domain tables + `users`, backfilled + indexed; `solaris_subjects.entity_type`; widened `solaris_identity_bindings.binding_type` CHECK to the full A2 set; `audit_logs.actor_subject_id` + `purpose` + `consent_scope`; re-backfilled subjects/email-bindings for users created since migration 023.
- `audit()` now records `purpose` + `consent_scope` + `actor_subject_id`.
- JWT carries `sub` = permanent Solaris `public_ref` (userId kept for compat).
- Domain writes (check-in) stamp `subject_id`.
- Rename sweep: “LUCA Passport” → “Digital Sovereign Passport” everywhere user-facing; admin “users” → “members”.
- Tests: `identity-spine.test.js` (+3). Backend 147/147, frontend 32/32.

M2 — Platform reliability · commit `a3ffff0`

- Structured LUCA JSON `{reply, suggestions:[{label,action,target}]}` with `JSON.parse` + graceful fallback, action from the typed A1 §5 enum — already in place from Sprint A; **added** rule-derived fallback chips (`buildTriggerSuggestions` in `luca-triggers.js`) so fallback suggestions come from fired A1 §6 rules first, then static defaults.
- Rule-based trigger engine in `buildContext` driving dashboard cards — verified.
- Widget + Coach share ONE persisted thread (`AppContext` + `sessionStorage`) — verified (Sprint A).
- Orientation grounding in `SYSTEM_PROMPT` (`ORIENTATION_PACK`) — verified.
- Idempotent seed + scoped `npm run seed:reset -- --email=<email>` that wipes only ONE member’s journey data and reseeds them (keeps everyone else); `seed / seed:reset` npm scripts now point at the canonical `seed_solaris.js`.

M3 — Member journey · commit `767d6f9`

- Role model (everyone a member; “Become a Practitioner” upgrade; existing practitioner accounts keep working) — verified in place.
- Passport hub actions (“Update my intake”, “Add health data”, “Book more tests” → Explore filtered to diagnostics) — verified in place.
- Daily check-in v2 (Mind/Body/Heart/Spirit sliders, rotating LUCA questions, weekly strip, habits, LOVE points + streaks, plus Sprint A sleep/water/meal) — verified in place.
- Explore “Curate for me” + curated rail — verified in place.

- Media player v2 (queue, seek, $\pm 15s$, playback speed, persistent mini-player, local file import) — verified in place (AudioProvider).
- Sign-out button bottom-left of the sidebar — verified in place.
- **NEW work (closing the cross-cutting invariant gap):** “Add health data” now stamps the four mandatory provenance columns on every shared fact.
- Migration **027** (additive): `provenance_level` (0–5 CHECK) , `source` , `observed_at` , `consent_scope` on `health_documents` (subject_id from 026); backfill + index.
- Backend `health-documents.js` : **de-identifies** the free text (emails, phones, long ID runs, the member’s own name/email) BEFORE the AI call; stamps `subject_id` + provenance; accepts `level/source/observedAt/consentScope`. A member self-note = L0/self; a marked lab result = L4/self (pending verification).
- `export.js` now serializes the provenance columns (vault roundtrip green).
- Frontend: data-type selector (Personal note L0 / Lab result L4) + observed date; `ProvenanceBadge` (L0–L5) on each shared document.
- Tests: `health-data-provenance.test.js` (+4).

Final verification

- Backend `npm test` **151/151** (20 suites); frontend `npx vitest run` **32/32**; `npm run build clean`; roundtrip `node tests/roundtrip.cjs` 9/9 structural assertions.
- `public/sw.js` cache bumped **solaris-v8** → **solaris-v9**.
- `docker compose build frontend backend` && `docker compose up -d` — all containers healthy; migrations current (“No migrations to run”); seed restored demo data.
- Live site <https://solaris-health.abacusai.cloud> returns 200; login/session works; zero console errors on dashboard; trigger-driven cards render; “Curate for me” present; “Sovereign Passport” branding. Provenance verified end-to-end via live API: L4 stamped, email scrubbed from LUCA summary.

Follow-ups / deferred

- M4–M8 not started by design (later subtasks).
- Provenance UI currently exposes L0 (note) and L4 (lab) self-submissions; L1–L3/L5 upgrade paths (observed/peer/institution/governed) arrive with the A3 Intelligence section (M5) and practitioner attestations.
